Randomized controlled study demonstrating failure of LPV/r monotherapy in HIV: the role of compartment and CD4-nadir

Christine Gutmann, Alexia Cusini, Huldrych F Günthard, Christoph Fux, Bernard Hirschel, Laurent-Arthur Decosterd, Matthias Cavassini, Sabine Yerly, Pietro Vernazza & Swiss HIV Cohort Study (SHCS)

Long-term side-effects and cost of HIV treatment motivate the development of simplified maintenance. Monotherapy with ritonavir-boosted lopinavir (LPV/r-MT) is the most widely studied strategy. However, efficacy of LPV/r-MT in compartments remains to be shown.
