Value of spatiotemporal representation of manometric data

Claudia Grübel, Richard Hiscock & Geoff Hebbard

High-resolution manometry with spatiotemporal representation of pressure data is a technique that has developed during the past 10-15 years. We compared spatiotemporal and traditional line plot representation of manometry data in a group of medical students in terms of the ability of the user to come to a rapid and accurate diagnosis and evaluated user preferences for the 2 forms of data display.
