Prevalence of SARS-CoV-2 Antibodies among Swiss Hospital Workers - Results of a Prospective Cohort Study

In this prospective cohort of 1'012 Swiss hospital employees, three different assays were used to screen serum for SARS-CoV-2 antibodies. Seropositivity was 1%; the positive predictive value of the lateral-flow immunoassay was 64% (IgG) and 13% (IgM). History of fever and myalgia most effectively differentiated seropositive and seronegative participants.
